

JCA designed and constructed an HVAC infrastructure upgrade to cater for a new NICU and ICU expansion project. This project involved the redesign and relocation of critical operating theatre engineering services together with enhanced critical care mechanical services within a bespoke roof plantroom. The design was carried out in the knowledge that the works would be completed in a live critical environment without the loss to normal operating theatre services.

HOSPITAL EXPANSION PROJECT LONDON

"This project was critical to the hospital as it was imperative that both the design and construction of this infrastructure upgrade met the strict requirements for hospital standards and compliance yet provided no disruption to day-to-day critical hospital facilities."

Mark Lynn, Head of Engineering, Chelsea & Westminster Hospital NHS Foundation Trust
