

AHU REPLACEMENT LONDON

Over 170 years, King's College Hospital has earned reputation as a world class hospital. It is both a leading teaching hospital and a local hospital covering South London. JCA was requested to replace existing AHU's and dedicated extract system serving one of King's College Hospital's buildings.

The plant room was located on a flat roof with two seperate AHU units serving the pharmacy and associated areas. Due to limited access to the roof area the new AHU units had to be delivered flat packed and constructed on site. JCA completed all the power, controls and BMS supplies, along with all the associated ductwork and LTHW pipework.
